

CERVICAL DYSTONIA CLINICAL STUDY

Cervical dystonia (CD) is a focal dystonia that affects the head and neck by producing painful contractions. These muscle contractions cause involuntary, repetitive movements and awkward positions of the head, neck, and sometimes shoulders.

ASPEN is conducting a clinical study across **the United States** to determine if a new investigational study drug for injection, is safe and effective for use in adults with isolated cervical dystonia and if the effects last longer than the current standard treatment.

To find out if you qualify for the **ASPEN** study, please [click here](#) to complete a short survey or you could contact 1-844-425-8022.

Qualified participants will receive all study-related exams, medications and care at no cost. Compensation for time and travel may be available.

Note: There are limited sites available in the States. [Click here](#) to find the nearest site to you.
